Customer Churn & Retention Dashboard

Datasets: RavenStack synthetic SaaS (credit: River @ Rivalytics) and Telco Customer Churn (Kaggle). Churn = account/customer lost; retention = 100% - churn.

Executive summary

• SaaS (RavenStack): 22.0% of 500 accounts churned; churned accounts held $2,355,245 of $11,338,747 cumulative subscription MRR (~21%).

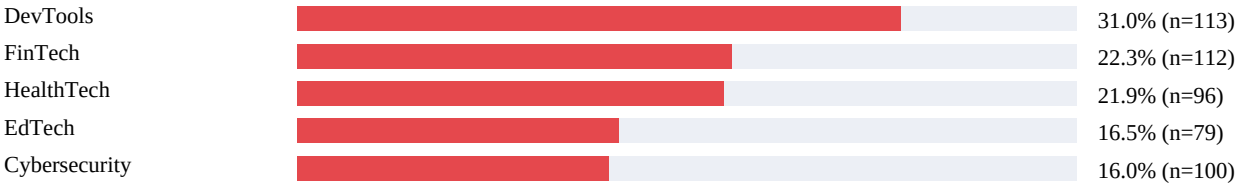
• Telco: 26.5% of 7,043 customers churned, losing $139,130/month (31% of monthly revenue).

• Biggest levers: contract length and first-year onboarding (Telco); acquisition channel, industry and trial conversion (SaaS).

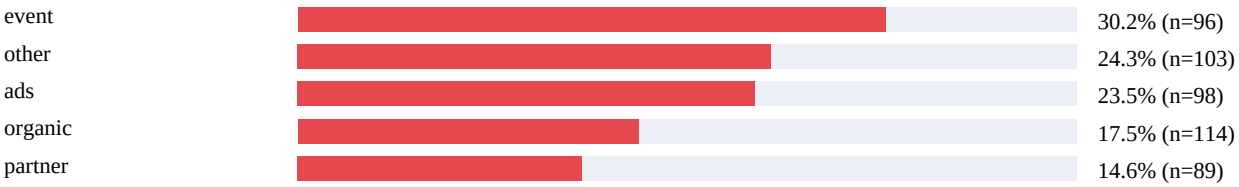
Part 1 - SaaS (RavenStack)

22.0%	$2,355,245	61	$8,652
Account churn	MRR of churned accts	Reactivations	Refunds

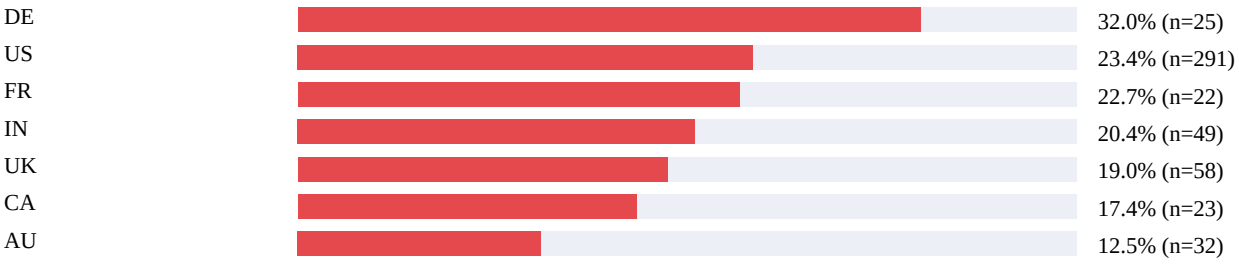
Churn by industry



Churn by referral source

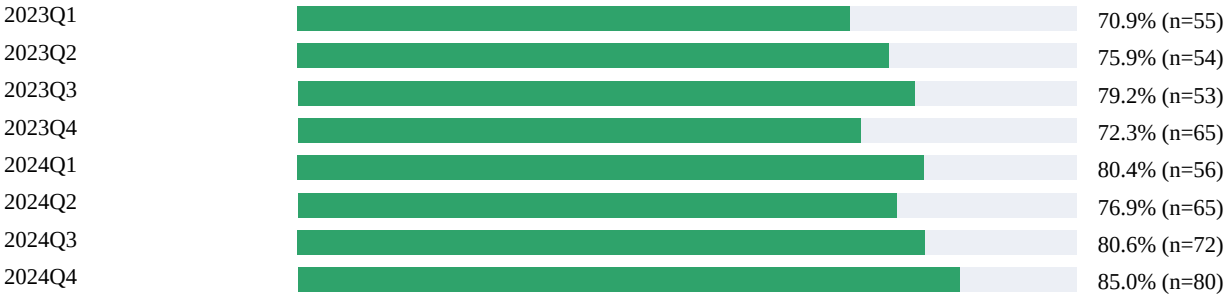


Churn by country



Churn by plan tier

Retention by signup quarter (cohort)



Stated churn reasons (events)

Support: active accounts 4.08 tickets, CSAT 3.95; churned 4.0 tickets, CSAT 4.0 - no meaningful difference.

Insights & recommendations

• DevTools (31%), event-sourced (30%) and German (32%) accounts churn about twice as much as Cybersecurity/EdTech and partner-referred (15%) accounts: shift spend to partner/organic channels and review DevTools fit and DE onboarding.

• Trial accounts churn more (26% vs 21%): improve trial-to-paid onboarding.

• Churn reasons are evenly spread; "features" is the top reason, so prioritise product gaps.

• Plan tier and support metrics do not separate churners: pricing tier is not the driver.

• Newer cohorts retain better (71% for 2023Q1 to 85% for 2024Q4), though recent cohorts have had less time to churn.

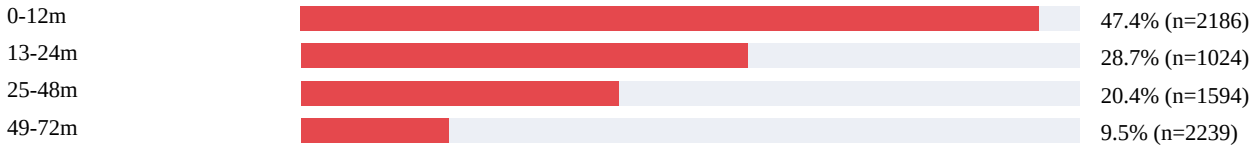
• Caveat: the data is synthetic and many variables are near-uniform, so small gaps may be noise.

Part 2 - Telco Customer Churn

26.5%	7,043	$139,130
Churn rate	Customers	Monthly revenue lost

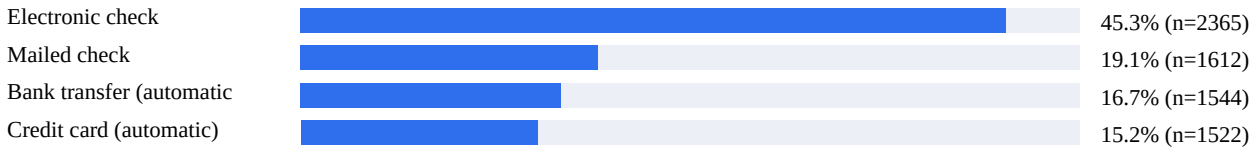
Churn by contract

Churn by tenure (lifetime)



Churn by internet service

Churn by payment method



Churn by tech support

Churn by senior citizen (1 = yes)

Insights & recommendations

• Month-to-month contracts churn 43% vs 3% on two-year plans: offer incentives to move customers to 1-2 year contracts.

• Risk is front-loaded: 47% churn in the first 12 months; invest in onboarding and early engagement.

• Fiber optic (42%) and electronic-check payers (45%) are hot spots: review fiber pricing/quality and promote auto-pay.

• Customers without tech support churn 42% vs 15% with it: bundle or promote tech support.

• Senior citizens churn 42% vs 24%: tailored support and plans.

Part 3 - Feature usage vs churn (RavenStack, 25,000 usage rows)

501	27.6	5.6%
Avg uses / account	Avg features / account	Error rate

Churned vs active accounts: uses 522 vs 495; features 28.3 vs 27.4; error rate 5.4% vs 5.7%. Beta-feature usage rows: churn 23.7% vs 22.8% for stable features.

Churn by usage-volume quartile (Q1 = lowest)

Churn by feature-breadth quartile

Churn by error-rate quartile

Insights

• Engagement metrics (volume, breadth, errors, beta usage) show no consistent monotonic relationship with churn: heavy users churn about as often as light users.

• Typical SaaS expectation (low usage = high churn) is NOT supported here, which again points to the dataset being synthetic. In a real product, track usage trend over time (drop in last 30 days) rather than totals.

• Recommendation: instrument time-based engagement signals and activation milestones for the real launch.
